To: Subject: STIC-Biotech/ChemLib SEquence Request

HI, this is a sequence search request for case 10/720424.

- Please Search Seq ID No. 1
   please search seq id NO. 8
- 3. Please search SEQ ID NO. 1 with word hits under 100
- 4. Please search SEQ ID No. 8 with word hits under 100

Thanks Katherine Salmon ART UNIT 1634 Mailbox REM2C70

mitochondrial tRNA.

Contributed on tape April 1983 by M.Sprinzl & D.H.Gauss; from their contributed on tape April 1983 by M.Sprinzl & D.H.Gauss; from their entry 1360 in Nucleic Acids Res. 11, r1-r54 (1983). N.crassa mt Met-tRNA-f resembles that of eukaryotic organisms in its structure, but its sequence honology is closer to prokaryotic sequences (although it resembles neither to any great extent [1]).

The invention relates to a general primer or primer pair for amplifying and detecting or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPV) genotypes. The general primers are useful for amplifying cervical-neoplasia related HPV genotypes including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New general primer or primer pair, useful for amplifying and detecting, or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPV) genotypes as well as cervical-neoplasia related HPV
                                                                                                                                                                                                                                                                                                                                                                                                                             Human papillomavirus genotype detection PCR primer

The general primers are useful for amplifying cervical-neoplasia related HPV genotypes including oncogenic high-risk groups and low-risk groups. The general primers are useful for producing amplifying products to DNA of scores of diverse oncogenic HPV types and thus detecting the oncogenic HPV types in a sample but also to select cervical carcinoma and its pre-stage lesions at searly stage by improving sensitivity according to HPV types. This sequence corresponds to PCR primer used in the invention.
oncogenic high-risk groups and low-risk groups. The general primers are useful for producing amplifying products to DNA of scores of diverse morogenic HPV types and thus detecting the oncogenic HPV types in a sample but also to select cervical carcinoma and its pre-stage lesions at early stage by improving sensitivity according to HPV types. The invention relates to a general primer or primer pair for amplifying and detecting or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPV) genotypes. The general primers are useful for amplifying cervical-neoplasia related HPV genotypes including oncogenic high-risk groups and low-risk groups. The general primers are useful for producing amplifying products to DNA of scores of diverse oncogenic HPV types and thus detecting the oncogenic HPV types in a sample but also to select cervical carcinoma and its pre-stage lesions at early stage by improving sensitivity according to HPV types. This sequence corresponds to PCR primer used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New general primer or primer pair, useful for amplifying and detecting, or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPV) genotypes as well as cervical-neoplasia related HPV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; brain expressed exon; gene expression analysis; probe; microarray;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes oligonuclectide libraries for detecting messenger RNAs that populate a (sub-)transcribtome, where the (sub-)transcribtom comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonuclectides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNAs encodes one or more messenger RNAs place variants. The oligonuclectide libraries are useful for detecting mRNAs from a bological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal constitutions of transcriptomes. The libraries may also be used as specialised minical libraries to detect transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue specific tissue under a specific pathological condition; to detect or pathological condition; to detect of a patient suffering from a particular and evaluation of a patient suffering from a particular and evaluates of a transcriptome of a patient suffering from a particular and situation of a patient suffering from a particular survey.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                                                                                                                                                                                                                                                  Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; de; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary hatlocytosis; lymphangioleiomyoncosis; Karagener syndrome; pulmonary alveolar proteinnosis; fibrocytic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon probe ORF from lung SEQ ID No 13617.

The invention relates to a spatially-addressation in a sample derived from human lung comprising single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung measuring gene expression in a sample contacting the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably contact acids from enkaryote lung mRNM, to a single exon probe, comprising (a) identifying exons from genomic sequence by the method above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above mentioned microarray; assigning exons in a single exon of the exons should be assigned to a single exon of the exons should be assigned to a single gene expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising cone of 12011 sequences, mentioned in the specification, or encoded by the expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising analysis, and for identifying exons in a gene; particularly using human cancer, chronic obstructive pulmonary disease ment as astima, lung derived many farter of lung derived many farter or min
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a single exon probe open reading frame of the invention. Note: The sequence for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RWA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinase CORI, PCNA and Cyclin BI.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1. The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [11] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and some and the sequences used in the
                                                                                                                                                                                                                                                                                     Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MNP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antistckling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 19 BP; 7 A; 3 C; 5 G; 4 T; 0 U; 0 Other;

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [I] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising and virucide activities, and seaves RNA encoding cytokine involved in inflammation. (I) can be used claseases such as psoriasis, atopic dermattits, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can disease for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing such as Medolog account as Medolog account as Medolog account as many present search as a such as a
                                                                                                                                                                                                                                                                                                                                                                                                                          Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   scar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a citoravae (I) which claeves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a conclet acid segment encoding (I). (I) can have antipsoriatic, anticleoratic, anticleborrheic, antidiabetic, antisickling, ophthalmological, cytostatic, antiebeborrheic, antidiabetic, antisickling, cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can disease such as proliferative eye diseases such as diabetic also be used for treating proliferative eye diseases such as diabetic retinopathy, vibreoretinopathy, alckle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing

The present invention relates to a novel pharmaceutical composition comprising: (a) an agent capable of modulating an expression level or protein activity of a cancer-related transmembrane protein (ERTP) or gene; an antibody specific for a CRTP, or cell activated by a CRTP; and antibody specific for a CRTP, or cell activated by a CRTP; and pharmaceutical composition may also comprise a comprise a complex of inhibiting or decreasing the expression of the CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, C20orf103, CACNALD, CDH6, CST, ENPP3, FLJ1856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The cancer, bung cancer, breast cancer, prostate cancer, lung cancer, breast cancer, prostate cancer, lung cancer, and esophageal cancer. The present sequence is a concer, stomach cancer, and esophageal cancer. The present sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences

The present invention relates to a novel pharmaceutical composition comprising: (a) an agent capable of modulating an expression level or protein activity of a cancer-related transmembrane protein (GRTP) or gene; an antibody specific for a CRTP, or a T cell activated by a CRTP; and (b) a carrier. The pharmaceutical composition may also comprise a polynucleotide capable of inhibiting or decreasing the expression of the CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3, PLJ11856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The pharmaceutical composition is useful for treating cancer, e.g. colon cancer, lung cancer, breast cancer, prostate cancer, liver cancer, kidney cancer, stomach cancer, and esophageal cancer. The present sequence is a cancer interfering RNAs (siRNA) oligonucleotide. Note: The sequence data for this patent did not form part of the printed specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition comprising an agent capable of modulating an expression level or protein activity of a gene, e.g. ABGC4, or a T cell activated by the polypeptide or antibody, and a carrier, useful for treating cancer.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Published Applications NA Main:*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 37597

Sequence 37597, Application US/11175859

Publication No. US20060024715A1

GENERAL INFORMATION:

APPLICANT: Affymetrix, Inc.

APPLICANT: Liu, Guoying et al.

TITLE OF INVENTION: Method of Analysis of Human Polymorphism

FILE REFERENCE: 3690.1

CURRENT APPLICATION NUMBER: US/11/175,859

CURRENT FILING DATE: 2005-07-05

PRIOR APPLICATION NUMBER: US 60/585,352

PRIOR APPLICATION NUMBER: US 60/585,352

PRIOR PILING DATE: 2004-07-02

SOFTWARE: PatentIn version 3.2

New general primer or primer pair, useful for amplifying and detecting, or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPV) genotypes as well as cervical-neoplasia related HPV genotypes.

Claim 1; SEQ ID NO 4; 71pp; English.

The invention relates to a general primer or primer pair for amplifying and detecting or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPV) genotypes. The general primers are useful for amplifying cervical-neoplasia related HPV genotypes including

Sequences were selected according to an unique algorithm developed to choose consensus sequences. The sequences represented in AAQ23167-88 are consensus sequences selected so each should hybridise with each of human HPV types 6, 11, 16, 18 and 33. The sequences represented in AAQ23095-189 and AAQ25590 allow the detection of small antes of HPV DNA, e.g. from cervical lesion samples, using PCR or LCR amplification procedures. The use of nucleic acids allows greater discrimination among viral subtypes than antibodies, and the use of DNA-based tests increases both the sensitivity and the
oncogenic high-risk groups and low-risk groups. The general primers are useful for producing amplifying products to DNA of scores of diverse oncogenic HPV types and thus detecting the oncogenic HPV types in a sample but also to select cervical carcinoma and its pre-stage lesions at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specificity of prior-art antibody based tests. The oligonucleotides can be used either to detect specific sequences of specific HPV types, or consensus regions with homology among different types
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Compsns. for amplifying DNA of human papilloma virus by LCR and PCR - consensus and type specific oligo-nucleotide(s), for diagnosis of HPV-esp. types 6,11,16,18 33 and 61.
                                                                                                                                                                                                              Gaps
                                                                          early stage by improving sensitivity according to HPV types. This sequence corresponds to PCR primer used in the invention.
                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match 89.0%; Score 25.8; DB 2; Length 38; Best Local Similarity 93.1%; Pred. The sequences AAT29826-T29921 represent primers and probes derived from human papillomvirus genomic sequences and are used to detect the presence of human papillomavirus types 6, 11, 16, 18, 31 and 33 in samples. The detection is either by PCR or LCR. Alternatively the sequences can be labelled with fluorescein or biotin and used as probes. (Updated on 25-
                                                                                                                                                                   primer; probe; human papillomvirus; PCR; amplification; LCR; ligation;
fluorescein; biotin; ss.

The present invention relates to a composition for preventing or treating tumours caused by human papillomavirus (HPV) 18, involving at least one fusion protein of at least one each of L and E proteins from one or more papillomaviruses, and optionally also additives or auxiliaries. The composition can be used as a vaccine to treat or prevent carcinoma of the lung, cervix, penis, vulva and anus. The present sequence is an HPV gene
                                                                                                                                                                                                                           Composition for treating and preventing tumors caused by human papilloma virus 18, contains fusion protein of papilloma virus L and E proteins,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence encodes a fragment of the human papillomavirus (PV) major capsid protein isolated from plasmid DL20. This fragment could be used as a reagent for detecting PV infections and diseases (e.g. warts or cancers of skin, cervix or mouth/throat, particularly of the skin). Cells containing transformants can be used to produce recombinant papillomavirus which can be used for diagnosis, treatment and prevention (as vaccines) of papillomavirus infection. papillomavirus (HPV) infection. More than 90% of cervical carcinomas are associated with infections of HPV31, HPV-33, -45, -52, and -58. The L1 associated with infections of HPV31, HPV-33, -45, -52, and -58. The L1 confidence is the major capsid protein and is highly conserved among different papillomaviruses. Expression of the L1 and L2 proteins in capsile of inducing high titres of neutralizing antibodies when administered into animals, without the potentially oncogenic viral administered into animals, without the potentially oncogenic viral cargets for the development of prophylactic and therapeutic vaccines for HPV infection. Vaccine development has been identified as immunological cargets for the development of prophylactic and therapeutic vaccines for HPV infection. Vaccine development has been limited by difficulties in obtaining high expression levels of capsid proteins. The present contains a nucleic acid (SEQ ID NO: 1) encoding HPVSB is protein (SEQ ID NO: 2), which is codon-optimized for high-level expression in yeast cells. Virus-like particles (VLDR) are also disclosed comprised of recombinant L1 protein or recombinant L1 + L2 proteins of HPVSB L1 gene, and cultivating the yeast under conditions that permit che HPVSB L1 gene, and cultivating the yeast under conditions that permit che WPVSP The The gene and vaccine are useful for immunoprophylaxis against containing the passion of the VDEs The gene and vaccine are useful for immunoprophylaxis against containing the passion of the VDEs The gene and vaccine are useful for immunoprophylaxis against containing the passion of the VDEs The gene and vaccine are useful for immunoprophylaxis against containing the passion of the VDEs The gene and vaccine are useful for immunoprophylaxis against containing the vaccine comprising containing the passion of the VDES L1 gene are useful for immunoprophylaxis against containing the passion of containing the passi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        papillomavirus infection, and for treating existing human papillomavirus infection. The present sequence is DNA encoding human papillomavirus 58 L1 protein, designated 58 L1 wt.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HPV-18; Ll gene; capsid protein; vaccine; diagnosis; vector; antibody;
